

## Monthly Investment Update

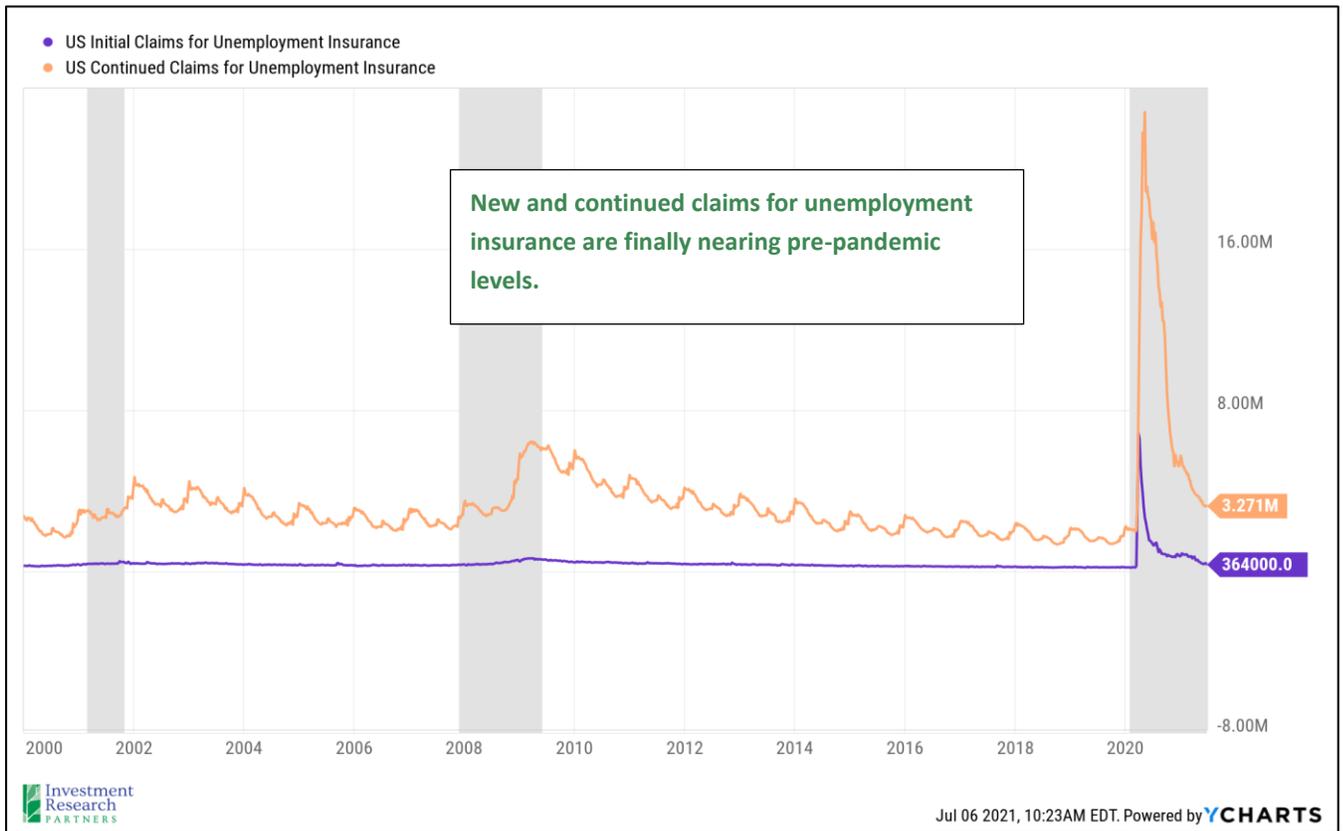

July 2021

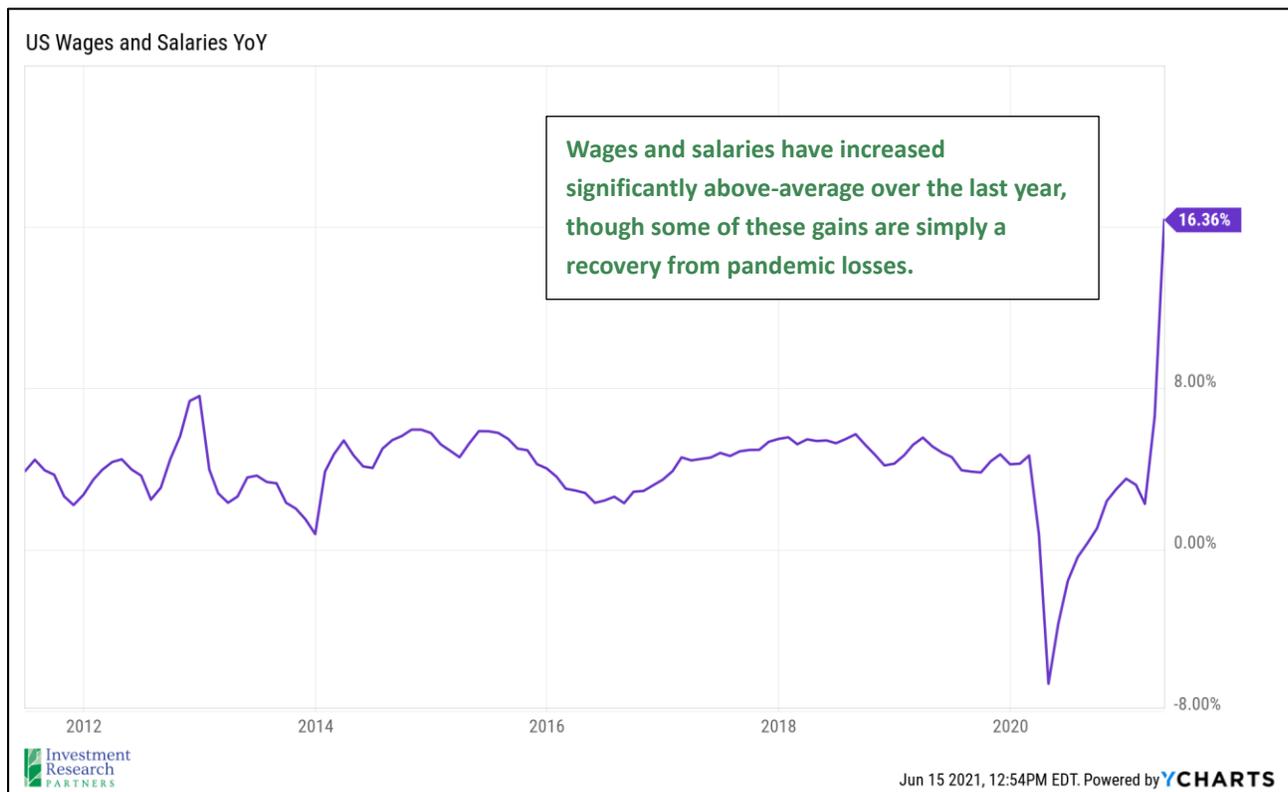

### Economy

The labor market continues to improve. Last Friday, the Bureau of Labor Statistics reported that US payrolls rose 850,000 in June to nearly 146 million. Despite the increase in the number of employed Americans, the headline unemployment rate actually rose to 5.9% from 5.8% in May as more individuals entered the labor force. Following a similar theme to the previous months of 2021, leisure and hospitality saw the largest gain in employment (+343,000 jobs) as restaurants, hotels, and travel all continue to return to pre-pandemic levels.

Encouragingly, the labor market has room for continued improvement, with total nonfarm payrolls still nearly 7 million below the high set in February of 2020. This implies that the economy has continued capacity for growth and improvement before traditional late-cycle wage pressures begin to challenge profitability. Of course, the confluence of factors such as abrupt economic shutdowns and re-openings as well as unprecedented stimulus have made this recession and recovery unique. Wage pressure and the availability of workers have already begun to challenge certain industries. Additionally, the number of workers leaving their jobs for better opportunities is now at an all-time high.

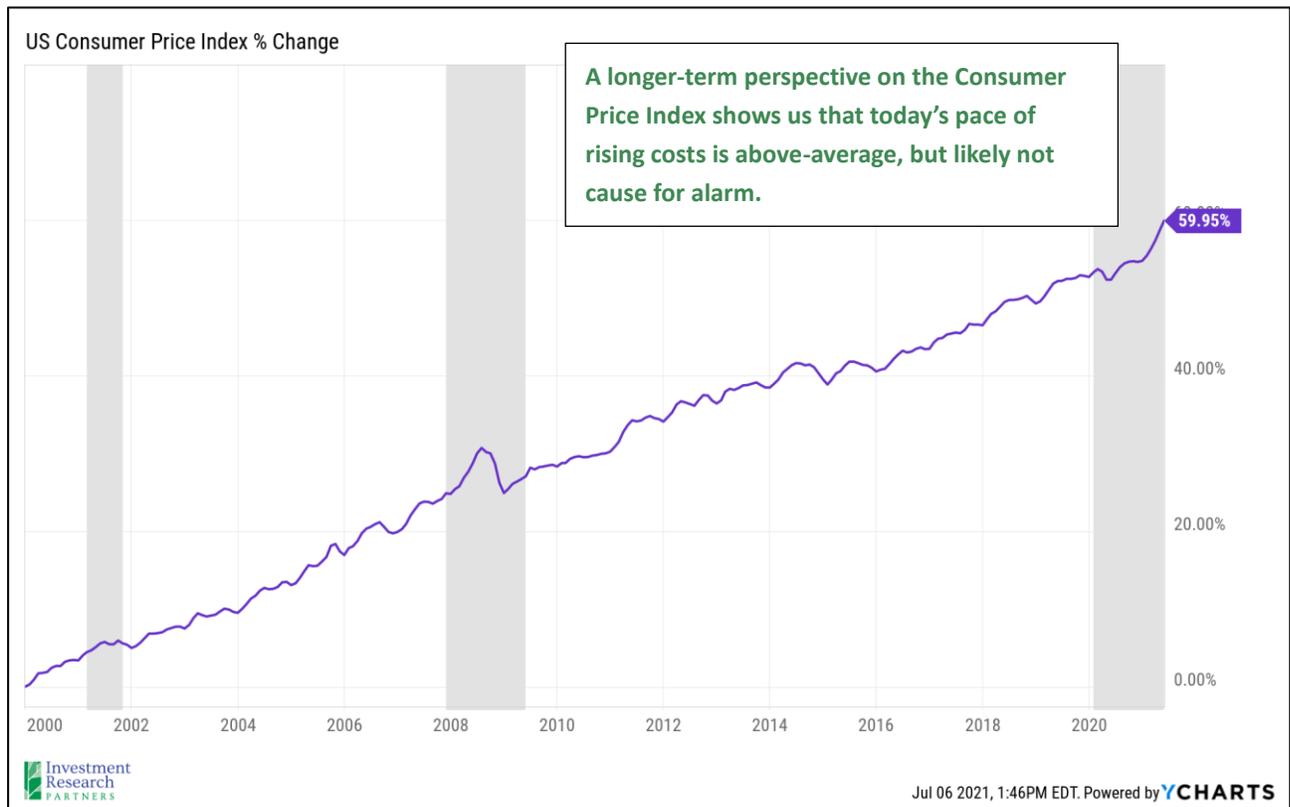

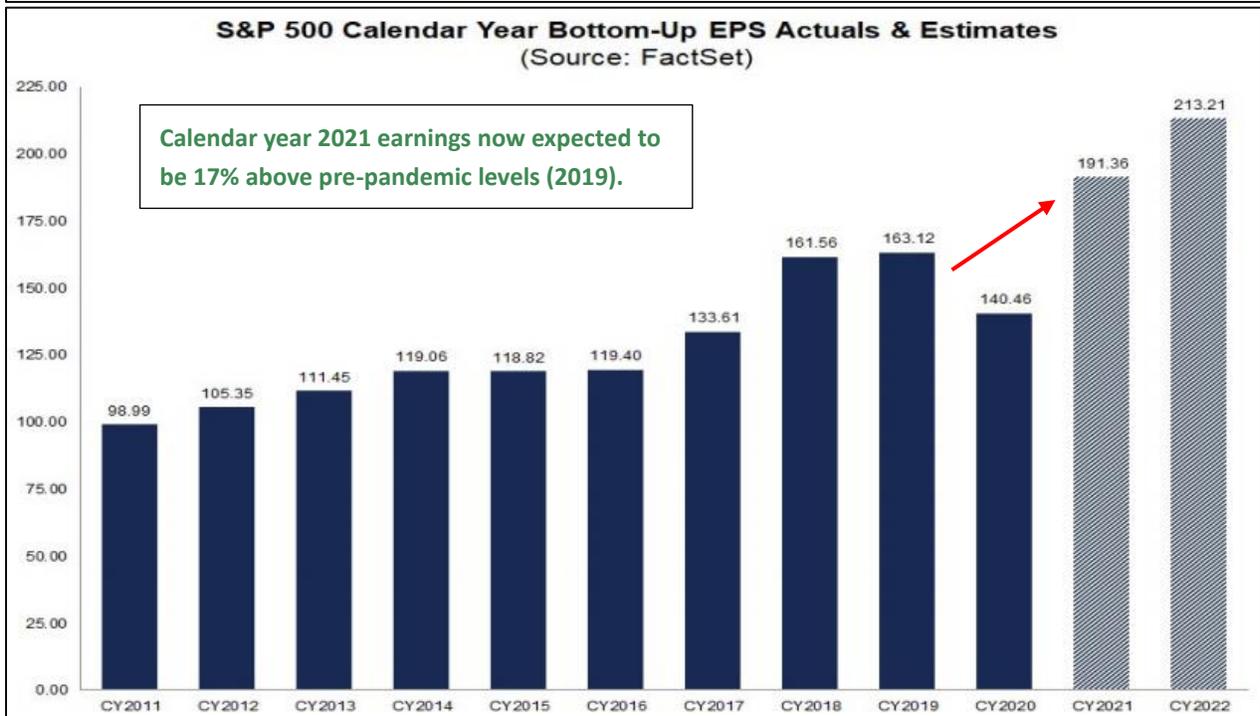

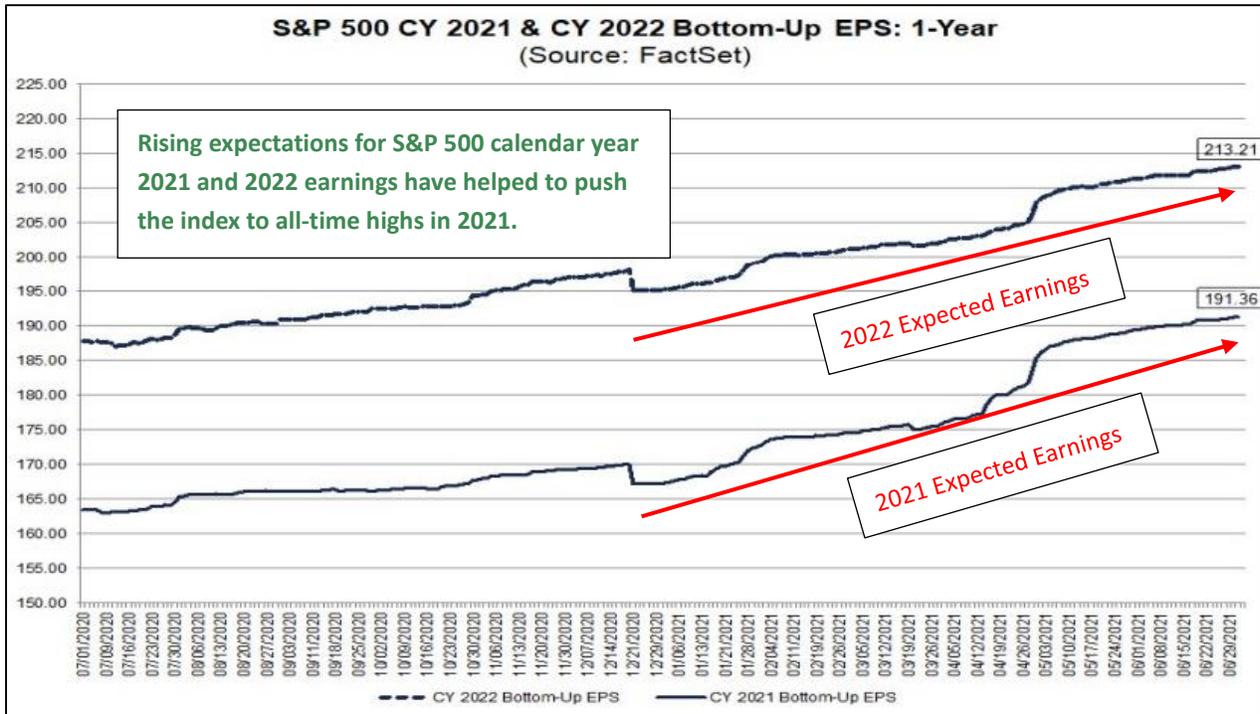

Inflation, or the potential for higher prices for goods, services, and assets, has become a concern for investors in 2021. For the last 10 years, the accommodative monetary policy from the US Federal Reserve and central banks globally has pushed the prices of assets such as stocks, bonds, and homes higher. This is potentially a positive form of inflation for those fortunate enough to own these instruments. For example, the average existing home sales price increased 117% since the start of the century, and the S&P 500 has returned 342%, despite three US recessions in the last 20 years.

However, traditional measures of inflation, such as the Consumer Price Index published by the Bureau of Labor Statistics, focus on costs of living such as food & beverages, housing, medical care, transportation, and education. Since the start of the century, consumer prices are 60% higher, with roughly 4.4% of that increase occurring in the last year ending June 30<sup>th</sup>. While the sharp increase in costs of living over the last year can be painful for those who do not own financial assets or who are on a fixed income, we believe that the current wave of higher costs will subside and trend toward normal levels. We expect that supply and demand for goods and services will find a natural balance over the next 12 months as more supply comes back online and demand from consumers moderates in the face of higher prices.

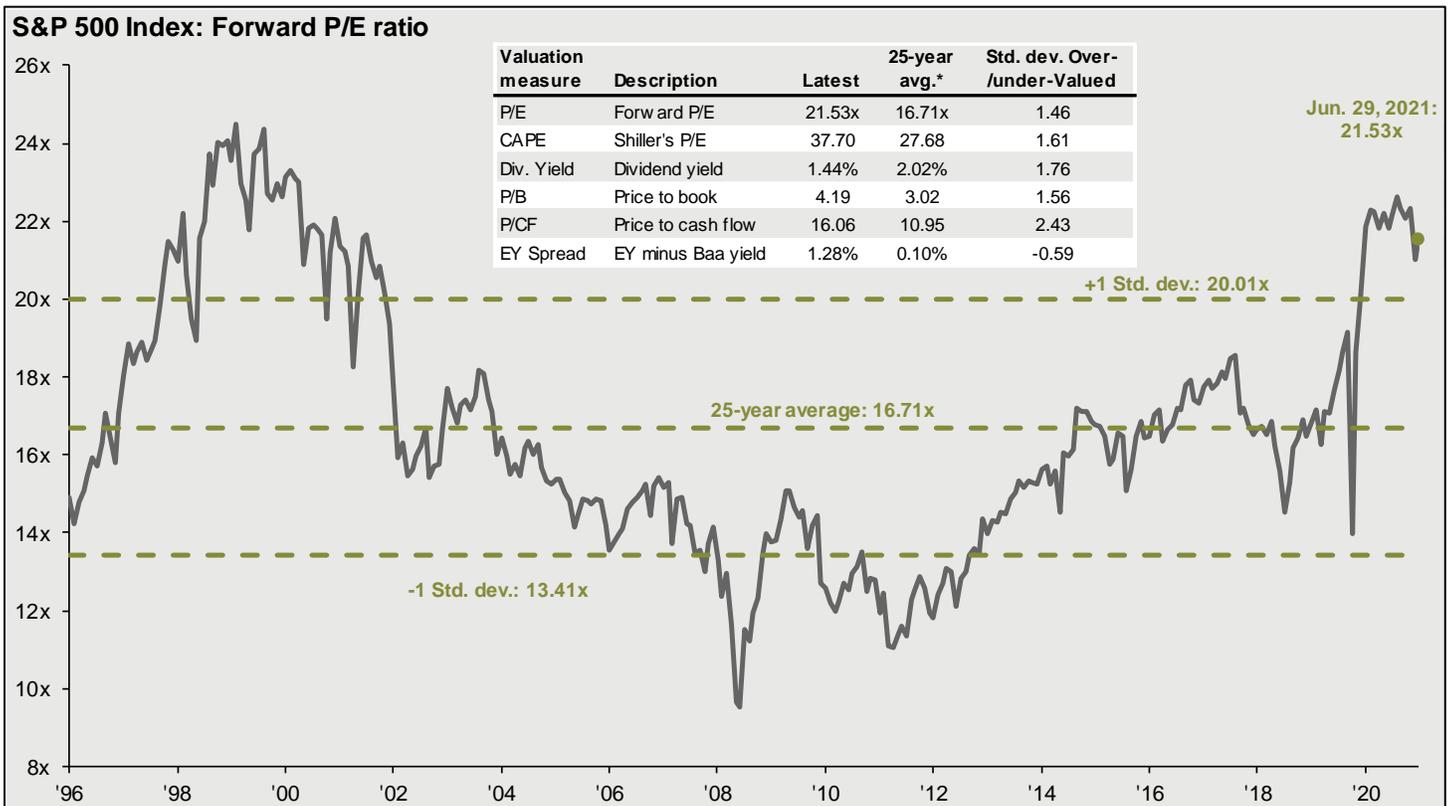

### Corporate Earnings

Earnings season is upon us, and the consensus estimate of analysts surveyed by Factset is for 64% year-over-year earnings growth for the second quarter of 2021. Of course, this year-over-year growth rate is significantly above average largely due to the wash-out in corporate earnings that was experienced in the second quarter of 2020 (the depth of the pandemic lockdowns).

## Valuation

The prices for risk asset classes such as equity and credit are above long-term averages, and this input is primarily responsible for holding back our overall risk-taking score (page 1). The chart below highlights the price investors are willing to pay for expected future earnings of the S&P 500 index (“forward price-to-earnings ratio”). This same relationship is true to varying degrees for most asset classes today. Encouragingly, the increase in reported and expected earnings have helped to push the S&P 500 index’s valuation back toward a range of normalcy over the last few months.
